

CLEAR WATER SERVICES

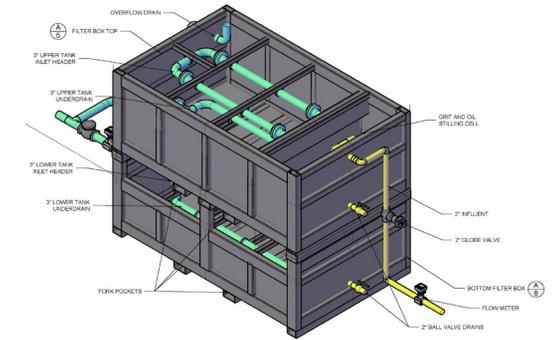

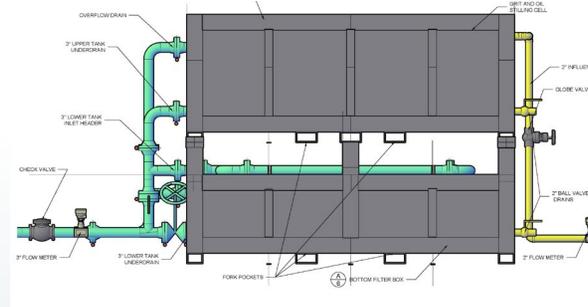

Passive Treatment System Technology

Treatment solutions for turbidity, pH, metals, hydrocarbons, organics, bacteria and nutrients

Stackable Tank Multi-Media System (STMMS)

Concept and Design

The Stackable Tank Multi-Media System (STMMS) is based off of the GRATTIX box idea, as it provides stormwater runoff treatment, with minimal infrastructure modifications at the Facility. The STMMS is a passive adsorptive-filtration treatment system developed to remove industrial stormwater pollutants with layers of inert and adsorptive filtration media. Pollutant removal is achieved by filtration and adsorption through the multi-media mix described below. Clear Water designed the STMMS to include additional adsorptive media for a longer media life and improved turbidity reduction to treat surface runoff.

Long Term Results
